Esquivel D., Santiago D., Barrera-Saldana H.:
"Independent duplication of the growth hormone gene in three
Anthropoidean lineages.";
Submitted (APR-2201) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Plays an important role in growth control. Its major
role in stimulating body growth is to stimulate both: the
other tissues to secrete IGF-1. It stimulates both: the
differentiation and proliferation of myoblasts. It also stimulates
amino acid uptake and proliferation synthesis in muscle and other
tissues (By similarity).
-!- SUBCELDULAR JOCATION: Secreted.
-!- SUBCELDULAR JOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE SOMAIOTROPIN/PROLACTIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         28-FEB-2003 (Re), 41, Last Sequence update)

"Cloning and characterisation of a putative growth hormone encoding
"cloning and characterisation of a putative growth hormone encoding
"cloning and characterisation of EMBL/GenBark/DDBJ databases."

Submitted (AUG-2000) to the EMBL/GenBark/DDBJ databases.

-! FUNCTION: Plays an important role in growth control. Its major
role in stimulating body growth is to stimulate the liver and
other tissues to secrete IGF-1. It stimulates both the
differentiation and proliferation of myoblasts. It also stimulates
amino acid uptake and protein synthesis in muscle and other
Lissues (By similarity. Secreted.
-: SUBCELLUIAR LOCATION: Secreted.
-: SUBCELLUIAR LOCATION: Secreted.
-: SUMILARITY: BELONGS TO THE SOMATOTROPIN/PROLACTIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 FPTIPLSRIFFUNAMIRAHRIHQLAFUTYQEFEEAYIPKEQKYSFLQNPQTSLSFSRSIPT

linked or non-covalently associated, in homopolymeric and
heteropolymeric combinations. Can also form a complex either with
OHBP or with the aipha2-macroglobulin complex.
SUBCELDULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          "The Suman growth hormone locus: nucleotide sequence, biology, and evolution.";

-:- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2 PPTIPLSRLFDNAMLRAHRIJIQLAFDTYQEFEEAYIPKEÇKYSFLQNPQTSLSFSRSIPT

Brother 1. 199:19-24(1968).

Finction: Plays an important role in growth control. Its major rele in stimulating body growth is to stimulate the liver and ciber lissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in mescle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zakin M.M., Poskus E., Dellacha J.M., Paladini A.C., Samtome J.A.; "Amino acid sequences around the cystine residues in equine growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Plays at important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete 167-1. It stimulates both the differentiation and proliferation of myoblasts, it also stimulates amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Seeburg P.H., Shine J., Martial J.A., Baxtor J.D., Goodman H.M.;

                                                                                                                            DNA encoding human insulin procursors - which comprise B- and
A-chains linked via amino acid chain contg. i or more glycosylation
sites, for propo. of insulic in tungal delis
                                                                                                                                                                                                                                           and A represent B- and A chains of insulin respectively, and Pg represents a modified C-peptide or any number of amino acids comprising at least one glycosylation consensus site, can be inserted into expression vectors which in turn can be used to transform fungal host cells. The fungal cells are then cultured and the insulin expressed in such cells can be harvested.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Insulin: precursor; growth hormone; chaperone; intramolecular;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 FVNQHLCGSHLVEALYLVCGERGFFYTPKTRRFAEDLQVGQVELGGGFGAGSL@PLALES 60
                                                                                                                                                                                                                                                                                                                                           The inventors claim a method for the prepat of an insulin priority in which the A-chain and 5-chain are joined through a connecting peotide. The connecting peptide joins the A-chain at the mained group of A-1 to the B-chain at the carboxyl group of B-30. The method is pref. for the prepat of human insulin precursor (see AAP46029). The SOS of the connecting peptides of a number of species are given (see AAP40023 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0: Gaps

Drecursor can be a component of chimeric proteins which additionally contains an Atenniana Insagnant of human growth hormone (Mai) and a cleavable peptide linker (AAVA285). The home provide humans a cleavable peptide linker (AAVA285). The home provide chimeric protein acts as an intramclecular chaperone (1MC) for the insular protein acts as an intramclecular chaperone (1MC) for the insular chaperone (1MC) for the insular chaperone (1MC) for the insular chaperone for the characteristic enabling it to fold correctly. The eleavable peptide linker confinent chaperone for the characteristic enabling it to fold correctly. The home protein of the characteristic enabling it to fold correctly. The degree of the fewer necessary procedural steps, and hence resulting in a higher yield of the fusion protein and decrease the intermolecular insular degradation by a microcialar the solubility of the fusion proteins and decrease the intermolecular interactions among the fission proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanadem bromide claesage, oxidative subhite systs and related contrations and evidence or validative subhite systs and related purification steps can thus be eliminated valor with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; insu:in-like growth factor 1, ISF-1; proinsuin; insulin.

The present invention describes an insulin-like growth factor (IGF)-1

24, 25, 43, 49 or 53, optionally in combination with an amino acid at

24, 25, 43, 49 or 53, optionally in combination with an amino acid at

position 12 and/or 16 of the native human IGF-1 sequence, is replaced

with an alanine, glycine, or a serine residue. The residue at position 7

may be rep, aced by any amino acid. (I) can have antidabetic, cardiant,

neuroprotective, anometic, tranquilliser, vubnerary, anometic,

nephrotropic, dermatological, antiHIV and antiviral activities. The IGF-1

mutants are used in any methods where IGFs or insulin are used, e.g. in

treating hypergycaemia, obesity-related, neurological, cardiac, renal,

munnological, and anabolic disorders. These disorders include lung

diseases, diometulomephritis, interstital nephritis. Turner's syndrome,

laron's syndrome, short stature, increased fat mass-to-lean ratios,

nmunnological disorders, peripheral neuropathy, multiple sclerosis,

muscular dysturchy, catabolic states, tranma, wounding, lifection,

human immunodeficiency virus (HVV), wounds, skin disorders, diabetes,

hart dysfunctions, kidney disorders, and whole body growth disorders.

They can also be used for increasing serum and tissue levels of

the libitation and insulin a mammal. The IGF-1 mutants improve the

halt-lives of IGF-1 and insulin. Sequence represents the

native furman proinsulin protein sequence, which is given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           90

It is used for the construction of pTrp24. The inventors claim a method for protecting bacteria from phage infection - by transformation with cloning vector contg. segment with restriction and modification activity. Prodn. of plasmid pPR 26 or pPR27 which uses pTrp24; and prodn. of plasmid pPR29 which uses a synthetic gene coding for the (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protecting bacteria from phage injection - by transformation with aloning vector confg. segment with restriction and modification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ċ
                                                                                                                                                                                                                                                                                                         disorders. The method comprises contacting cutilidate with an artifly seen such as insulin like growth factor (16F-1) and/or with a kinding artifly preference for 10FBF 1, an LEF and owith a binding protein-7 (16FBF) 40 for 10FBF 1, an LEF and owith a binding affining preference for 16FBF 1 over 16BBF 3, or a 10FBF displacer peptide that prevents the interaction of 16FBF 40 and done not bind to human 16F receptor. The method is useful for treating cartillage disorders (CD) including degenerative CD, articular CD such as rheumatoid arthritis and obscourthoils. The present sequence is human profisult, which was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 FVNORLGGSRLVBALXIVGGERGFFYFPKTRREABDLØVGQVFLGGGDPGAGELGPLALEG F.: (1111) + 111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1111) + 1111; (1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The inventors claim new recombinant plasmids contr. a DNA sequence, encoding a polypeptate, which is foreign to E.coi. In readent phase with a DNA SQ, coding for a least one innerlional iragent derived from an outer membrane lipoprotein gene of E.coli. The foreign gene may be for human insulin. The ilopprotein green functional iranment may be for human insulin. The ilopprotein green functional iranment may be the promoter, the 5'-UPR, the 3'-UTR or the transcription termination signal provided that it includes at least the promoter.
readily isolated from cell lysates and is stable on washing with urea or detergent spins, at low opens, The grant, contains at least 50% of probabilization and isolation operations are simplified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant plasmid; E.goli expression vector; secretion vector

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  this sequence represents human proinsulin and was decoded from the sequences given in AAQ36996-7001. The CDNA fragment coding for proinsulin was inserted into plasmid vector profit and digested with KPLI and HindIII. This resulted in the formation of the vector pPLNS A trayment encoding amino acids 1-73 of CAT (see AAQ37002) was inserted into pPLNS to give a plasmid which contained DNA sequences which coded for amino acids 1-73 of CAT, an 8 amino acid linker sequence and human proinsulin. This plasmid, pUC-CAT-proinsulin, could be used in the formation of insulin analogues which may be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 FVNOHILGGSHLVEALYLVCGERGFFYTPKTRREAEDLQVGQVELGGGPGAGSLQPLALEG

This dipeptide is linked to the natural human insulin before its connection peptide and natural human insulin Administration of Dipeptide removal is carefully controlled to obtain the desired prod. Without further degradion occurring, irrespective of whether the next dipeptide in the sequence defines a cathepsin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents an analogue of native human proinsulin (hpI). The SMA encoding this sequence was used in the construction of the expression vector of the invention. The coding region of the hpI gene was synthesised and was cloned into the expression plasmid pCZRIZ6S (see also AAQ38307). Expression of this gene lead to the inclusion of an extra amino acid (Arg) in the second position from the N-terminal of mature hpI. The extra amino acid provides increased expression levels of the protein and is then cleaved off to avoid undesirable (updated on 25-MAH-200) to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PVNQHLGSSHLVEALYLVCGERGFFYTPKTRREAEDLOVGQVELGGGPGAGSLQPLALEG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The fusion product is encoded by a synthetic sequence having at its 5'-end a medification of the 3'-end or the naturally occurring alpha-factor secretory leader and processing signal sequence, where three G.u.Aia pairs have been deleted. A plasmid containing the synthetic proinsulin coding sequence was used to transform kex2-mutant yeast strains in the presence or absence of the closed KEX2-ques. Post-translational processing of pro-insulin into peptides only occurred in yeast transformed to KEX2 plus, see also AA220545. (Opdated on 25-MAR-2003 to correct PA field.)
                                                                  BCA-5; yeast preferred codons; postitranslational procession; insulin; endopeptidase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%, Score 463; DB 13; Longth 92; 100.0%, Pred; No. 9e-43; ive 0; Mismatches 0; Indels
